

ADARVE

Fombella 1977

ADARVE Fombella 1977, p. 117: "Vesicle of spherical to subspherical form ornamented by a fine positive hexagonal reticulum which is formed by bacculate elements which are distinctly separated from each other without a trace of a membrane between them. The nodes of the reticulum are accentuated by slightly larger elements. The fields are smooth. No endodermal structures observed; mode of excystment unknown". (A. diafanum: Fombella 1977, p. 117, Pl. 1:4).- text-fig. 3:7.
