

LOMATOOPAS

Playford in Playford and Dring 1961

Diagnosis: Vesicle circular in outline, with continuous, relatively narrow, often distinctly elevated, peripheral border or rim that has sharply or rather inconspicuously defined inner limit and is characterized by distinctly pitted surface. Vesicle wall encompassed by rim has virtually featureless surface. No excystment opening observed

Type species: *Lomatopas cellulosa* Playford in Playford & Dring 1961

Remarks: No closely comparable palynomorph appears to have been described in available literature.
