Arkhangelskiella cymbiformis

**Arkhangelskiella cymbiformis** Vekshina emend. Prins & Sissingh, 1977

**Remarks:**

Various types are referred to this species by various authors. In this paper the type is characterized by a relatively broad rim, clearly subdivided in two or more layers. In plan view these layers are visible as three or more concentric rings. The plate area bears large perforations per quadrant i.e. three along the long suture, and two along the short suture. There are no marginal perforations as in closely related species.

**Type species:**

*Arkhangelskiella cymbiformis* Vekshina, 1959.

**Author:**

Prins B. & Sissingh W., 1977, p. 60.
