

DELTOTOSOMA

Playford in Playford & Dring 1961

Diagnosis: Vesicle hollow, single-layered; outline triangular or nearly so. Vesicle wall essentially plicate between processes which are numerous, solid, elongate, essentially homomorphic, and typically discrete. Processes commonly have simple or, rarely, branched distal tips. Excystment mechanism unknown.

Type Species: Deltotosoma intonsum Playford in Playford and Dring 1961

Remarks: Deltotosoma and Gorgonisphaeridium Staplin, Jansonius and Pocock 1965 embrace forms with similar solid processes, but have vesicles of respectively triangular and circular outline
