

HELIOSPHAERIDIUM

Moczyłowska 1991

p. 59

Type species: *H. dissimulare* (Volkova) Moczyłowska 1991

Diagnosis: Organic-walled microfossils with spherical to oval, thin-walled, single-layered vesicle. The central body bears variable number of processes which are hollow and communicate with the central body cavity, but closed at the tips. The wall and processes have the same appearance. The bases of the processes have variable shapes and are generally widened. The processes are homeomorphic but occasionally a few of them may differ in shape. Excystment not observed.

HELIOSPHAERIDIUM
