

Amphizygus microminutus HATTNER & WISE, 1980

Figs. 1, 2 — *Amphizygus microminutus* n. sp. 1) Holotype, $\times 21,500$;
2) Paratype, $\times 23,000$.

Description:

Diagnosis: An extremely small species of *Amphizygus* which has two perforations and a stem.

Description: In distal view the simple rim in this species is composed of approximately 24 radial elements which render a smooth outline. The central area has two small perforation which lie closer to the stem than the rim. The central area is surmounted by a stem composed of irregular blocky elements.

Size: Holotype 2.6 μm long, 1.8 μm wide; paratype 2.3 μm long, 1.5 μm wide.

Remarks:

This species, observed only in distal view, differs from *A. minimus* BUKRY (1969) by its smaller size (2.6 μm vs 4.6 μm maximum diameter) and the presence of a central stem.

Type level:

Lower Campanian.

Type locality:

Clubhouse Crossroads Corehole 1, 1603 ft, 25 miles west of Charleston, South Carolina, USA.

Depository:

Department of Oceanography and Geology, Florida State University, Tallahassee,
Florida.
