

Hemistomiosphaera NOWAK, 1968

Description:

Spherical unilocular microfossils possessing test with fibrous structure, composed of several layers consisting of minute and short fibers radially disposed.

Remarks:

The presence of multilayered test with fibrous structure and the morphological features do not allow to include these forms to *Cadosina* WANNER, but to join them with other genera possessing tests with radial structure and belonging to *Stomiosphaeridae*.

Type species:

Cadosina parvula NAGY, 1966.
