

59. *Nephrolithus miniporus* Reinhardt & Górká (1967)

Pl. 32, fig. 11

Fig. 11. *Nephrolithus miniporus* n. sp., CO 20, Męcńmierz 1 (18,2/97,3), plan view, phase contrast, 3000X.

Pl. 33, fig. 5

Fig. 5. *Nephrolithus miniporus* n. sp., holotype, electron microscope photograph, Męcńmierz, 8000 X, no. 105/7.

Holotypus: Pl. 33, fig. 5.

Locus typicus: Męcńmierz.

Stratum typicum: Upper Maestrichtian.

Diagnosis: Kidney-shaped coccolith with two rims and a central area composed of two to four ring-shaped structures, each of which with a central pore, pores arranged uniserially.

Comparison: *Nephrolithus miniporus* shows only uniserially arranged pores, *Nephrolithus frequens*, *Nephrolithus trientis* and *N. barbarae* have biserially arranged pores.

Distribution: Upper Maestrichtian of Męcńmierz and Góra Puławska.

Reinhardt, P. & Górká, H., 1967. Revision of some Upper Cretaceous Coccoliths from Poland and Germany. *N. Jb. Geol. Paläont. Abh.*, **129(3)**: 240-256.
