

189. *Quadrum eptabrachium* Varol (1992)

Q. eptabrachium

Pl. 2, fig. 6

Q. eptabrachium

10 μ m

Pl. 7, fig. 4

Diagnosis: A species of *Quadrum* having seven ray-like elements in each cycle of the wall.

Derivation of name: From Greek *epta*, seven and *brachium*, arm referring to the seven ray-like elements in each cycle of the wall.

Holotype: Pl. 2, Fig. 6.

Type level and locality: Turonian, British sector of the North Sea area.

Dimensions of holotype: Maximum diameter: 5.8 μ m.

Occurrence: *Quadrum eptabrachium* is present in Turonian to lower Santonian sediments throughout the world.
