Tegumentum THIERSTEIN, 1972

Description:
The species of the genus *Tegumentum* n. gen. have a wall of strongly imbricate elements, a proximal rim of small elements, X-shaped crossbars, and a band of nonimbricate tabular elements covering the outer margin of the wall. The genus *Tegumentum* n. gen. is distinguished from other members of the family Eiffelitacea Reinhardt 1965, emend. Perch-Nielsen, 1968 by its cover of tabular, nonimbricate elements along the outside of the wall.

Type species:
*Tegumentum stradneri* THIERSTEIN, 1972.

Author:
Thierstein H., 1972, p. 437, in Roth P.H. and Thierstein H.
