**Wiseorhabdus**

**Wiseorhabdus** _Bukry, 1981_

**Description:**

Elongate, calcite rods are composed of several radial keels parallel to the major axis. The ends of the rods are blunt or pointed. The multiple keels may not be arrayed symmetrically (Wise and Constants, 1976).

**Remarks:**

_Wiseorhabdus_ is distinguished from _Lithraphidites_ and _Triquetrorhabdulus_ by having more than four keels and by lacking exact radial symmetry about the major axis (Wise and Constants, 1976).

**Type species:**

_Wiseorhabdus inversus_ (Bukry and Bramlette, emended Wise and Constans).
